Queues

Help for this Page

Queues allow groups of users to manage a shared workload more effectively. A queue is a location where records can be routed to await processing by a group member. The records remain in the queue until a user accepts them for processing or they are transferred to another queue. You can specify the set of objects that are supported by each queue, as well as the set of users that are allowed to retrieve records from the queue.

SETUP

Presence Configurations

Presence Configurations

Define how much work agents can accept and which Omni-Channel features they can access. Create multiple configurations for different groups of agents who support different channels.
